A hardware wallet you wear

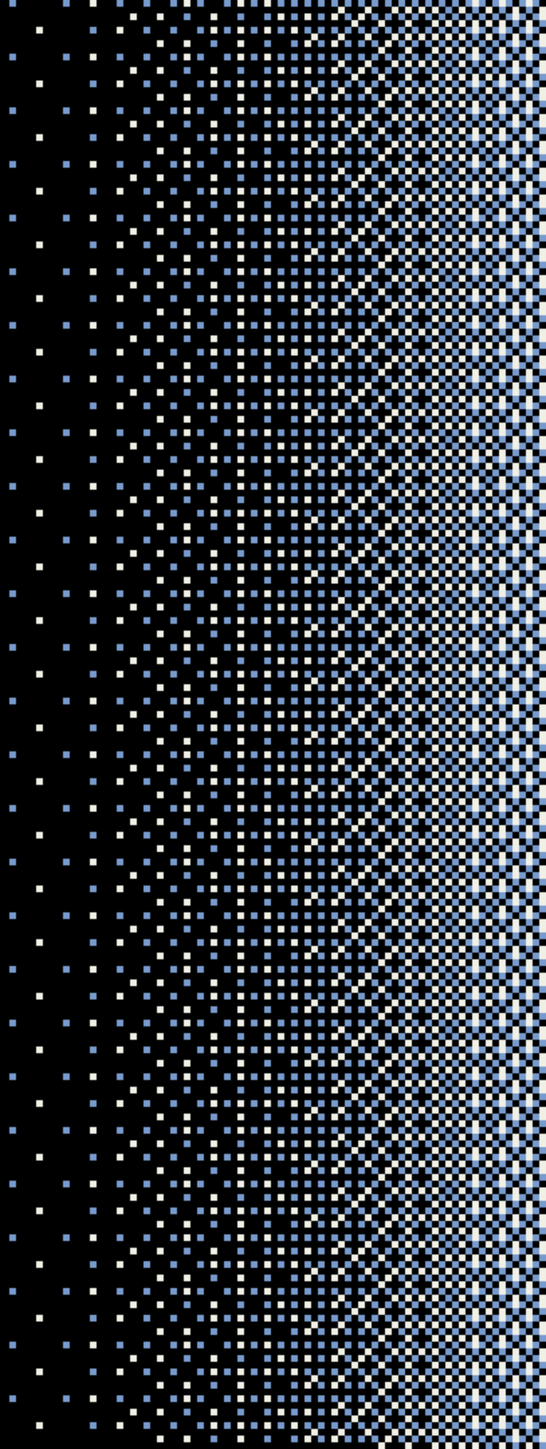

A simple resin watch that signs Solana.
The key never reaches the phone app.

Hardware wallets are a second object

- People don’t carry them.
- So they sign on the phone, beside every other app, or they don’t sign at all.

The watch is already on.

Signed in the simulator. Accepted on devnet

How it works

1

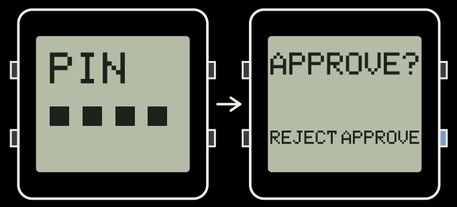

Phone app builds the transaction

2

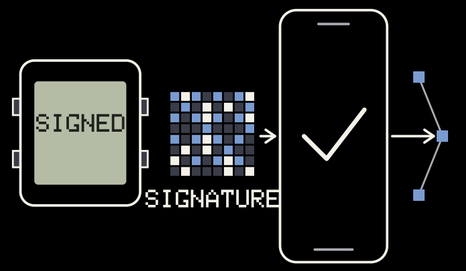

Watch parses the bytes it signs

3

PIN, then a separate approve

4

Signature returns; phone app broadcasts

The key never reaches the phone app.

Why Solana

Native Ed25519

Signs the bytes it shows. No hashing, no second curve.

Fast confirmation

A wrist approval fits in a blockhash’s lifetime.

Android first

The phone app is the wallet; the watch signs. iOS later.

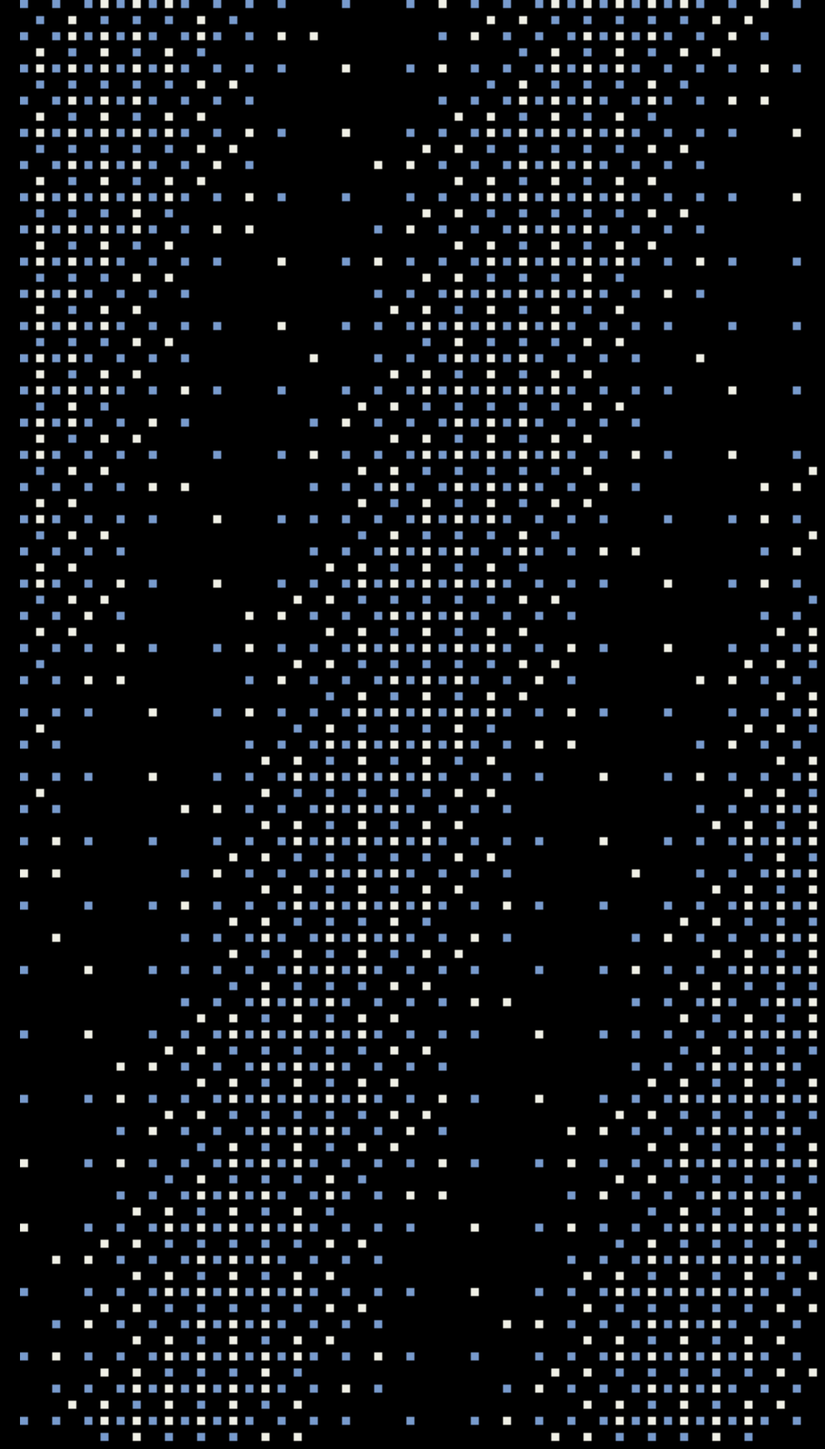

We sell the watch.
The phone app is free

Who buys first

Solana users who keep funds in self-custody and sign every day.

How they find it

Wallets that list SEKUND as a signer. Then the Solana Mobile dApp Store.

Team

Goran Petkovic

Product designer and developer
(product work for Motif Finance, Twilight, BitDSM)

Srdjan Solajic

Engineer

One working prototype in 90 days

- TROPIC01 holds the key
- nRF52840 runs the screen, buttons, Bluetooth
- Pairs with Android
- Squads vault recovery

Target design, render.

The ask

- A place in the accelerator
- A hardware partner
- A Solana Mobile introduction

Lose the watch, not the funds

SEKUND is one signer in a Squads vault.
A lost watch is replaced; the funds stay.

The recovery design. In the 90-day plan, not the demo.

Shipped this week

- Signing core, with a PIN and a separate approve
- A devnet transaction, signed in the simulator
- A phone app that builds, verifies and broadcasts
- The chips are roadmap

3D simulator, live LCD.

A hardware wallet you wear

A simple resin watch that signs Solana.
The key never reaches the phone app.

Fund SEKUND: accelerator, a hardware partner, Solana Mobile.
